

Title: Bentley Geospatial Server, a Robust Approach for Generation and Documentation of 3D Data

Short abstract:

Bentley Geospatial Server connects the database (Oracle Spatial or ArcSDE) with the different tools to manage or show the data. Based on this Bentley MAP as a desktop GIS could be used for producing and manipulation data. Using of point clouds is as well possible as the editing of raster data for texturing the 3D models. On the other side the viewing of data is managed via another new Bentley Product: GeoWeb Publisher V8i Select Series 2. With a direct Oracle Spatial Connector it is a fast possibility to see geodatabase data as well as special produces mapping data.
