

# Denmark's National Digital Twin

Agency for Climate Data

# Digital Twin as common reference frame

- 3D-data management system (vision: future basic public data)
- Standardized and updated
- Object-based model with unique ID's. Possible to connect to other registers
- Function as a platform for IoT and Smart City.

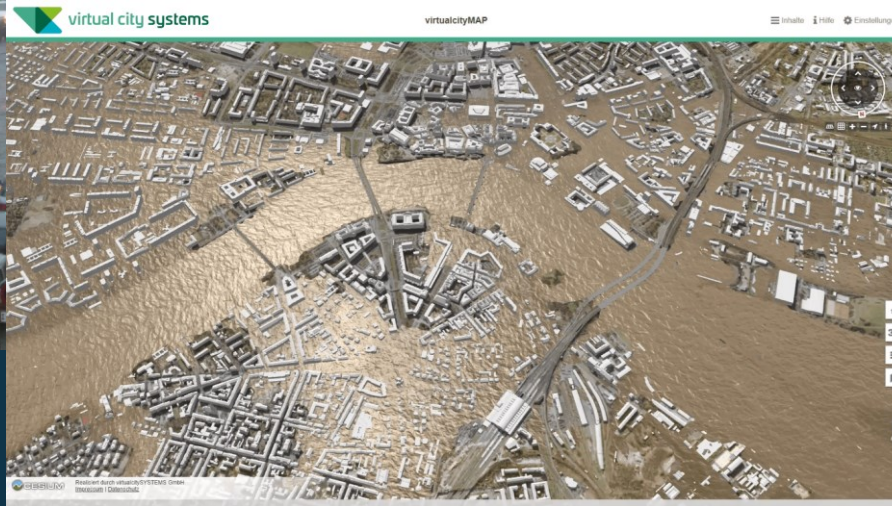

Buildings can be divided into different objects e.g. roofs and facades

# Examples of use cases :

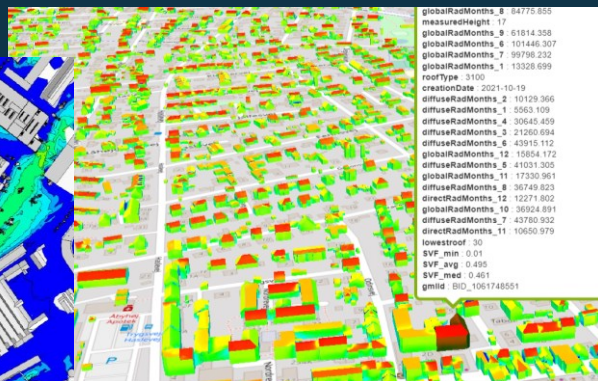

Climate adaption

- Paradisæblevej 111
- Solar cell potential: 54
  - Energy certificate:
  - Annual consumption:
  - Number of windows : 45
  - Heating type: gas

Energy optimization

Analyzes: view, wind, noise, light/shadow, solar potential

Physical planning

## DATA FOUNDATION:

- The Danish elevation model
- Building polygon from GeoDanmark (footprint)
- GeoDanmark orthophotos

*The Danish Elevation Model*

*GeoDanmark-buildings*

*Orthophotos*

# CityGML: Levels of Detail (LOD)

**LOD0** is a 2.5D Digital Terrain Model that can be draped with aerial photos or maps.

**LOD1** is a “brick model” and the simplest model type. The houses appear with flat roofs.

For a **LOD2** building, the most basic roof surfaces are raised, i.e. a gable roof.

A **LOD3** building is an architectural model and erected with all roof structures, as well as windows and doors.

A **LOD4** building is an architectural model with interior information such as rooms and furniture.

## Buildings

- GeoDanmark building polygons
- DEM is used to calculate height and estimate roof shapes
- Updated continuously when there are changes to polygons and/or DEM

## Terrain

- Mesh based on DEM
- Draped with the latest GeoDanmark orthophoto in the client
- Updated when there is new DEM

## Trees

- GeoDanmark individual trees and tree groups
- Height from DEM
- Summer and winter themes
- Continuously updated when there are new trees and/or DEM

**Basic model in production in 2025**

# 3 development projects

## Draping of oblique images

- On the fly draping
- Visualization

## Hydrology

- Converting hydrological data to be used in 3D
- What happens during:
  - › extreme rainfall scenarios
  - › storm surge
  - › floods
- Visualization

## Forests

- Tree detection in Danish forests
- Classification of species
- Visualization

# Hydrology

Visualization of storm surge scenario of 6 m in Aarhus in Denmark's Digital Twin with 3D orthophotos

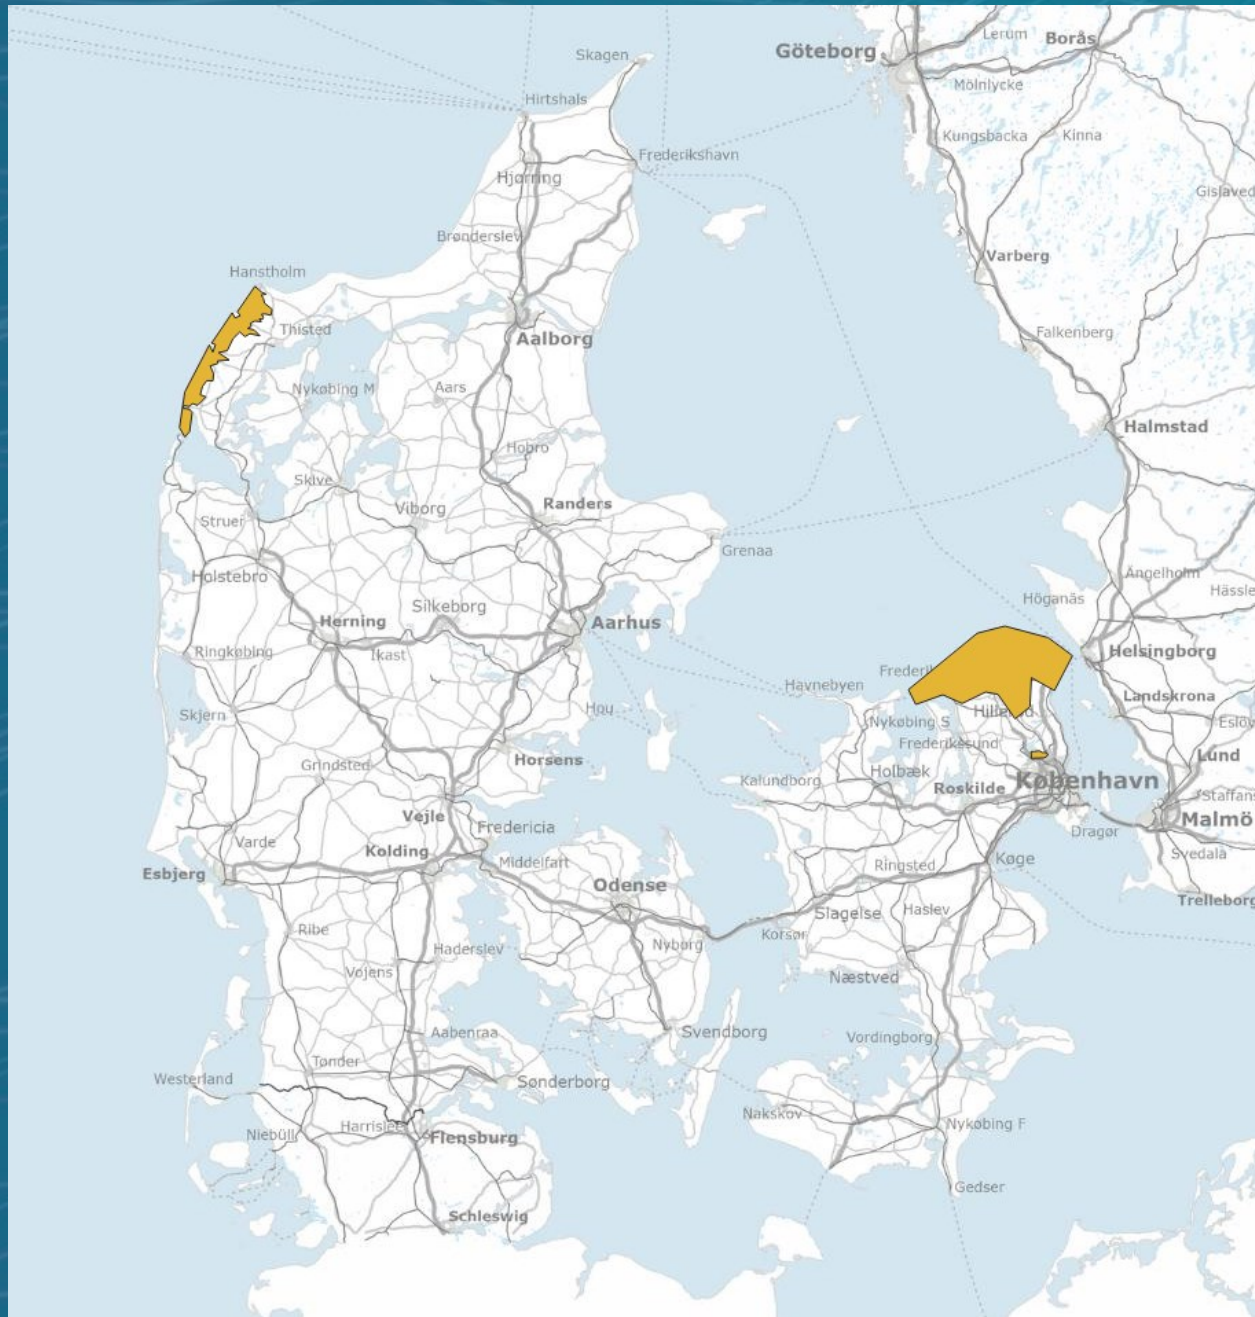

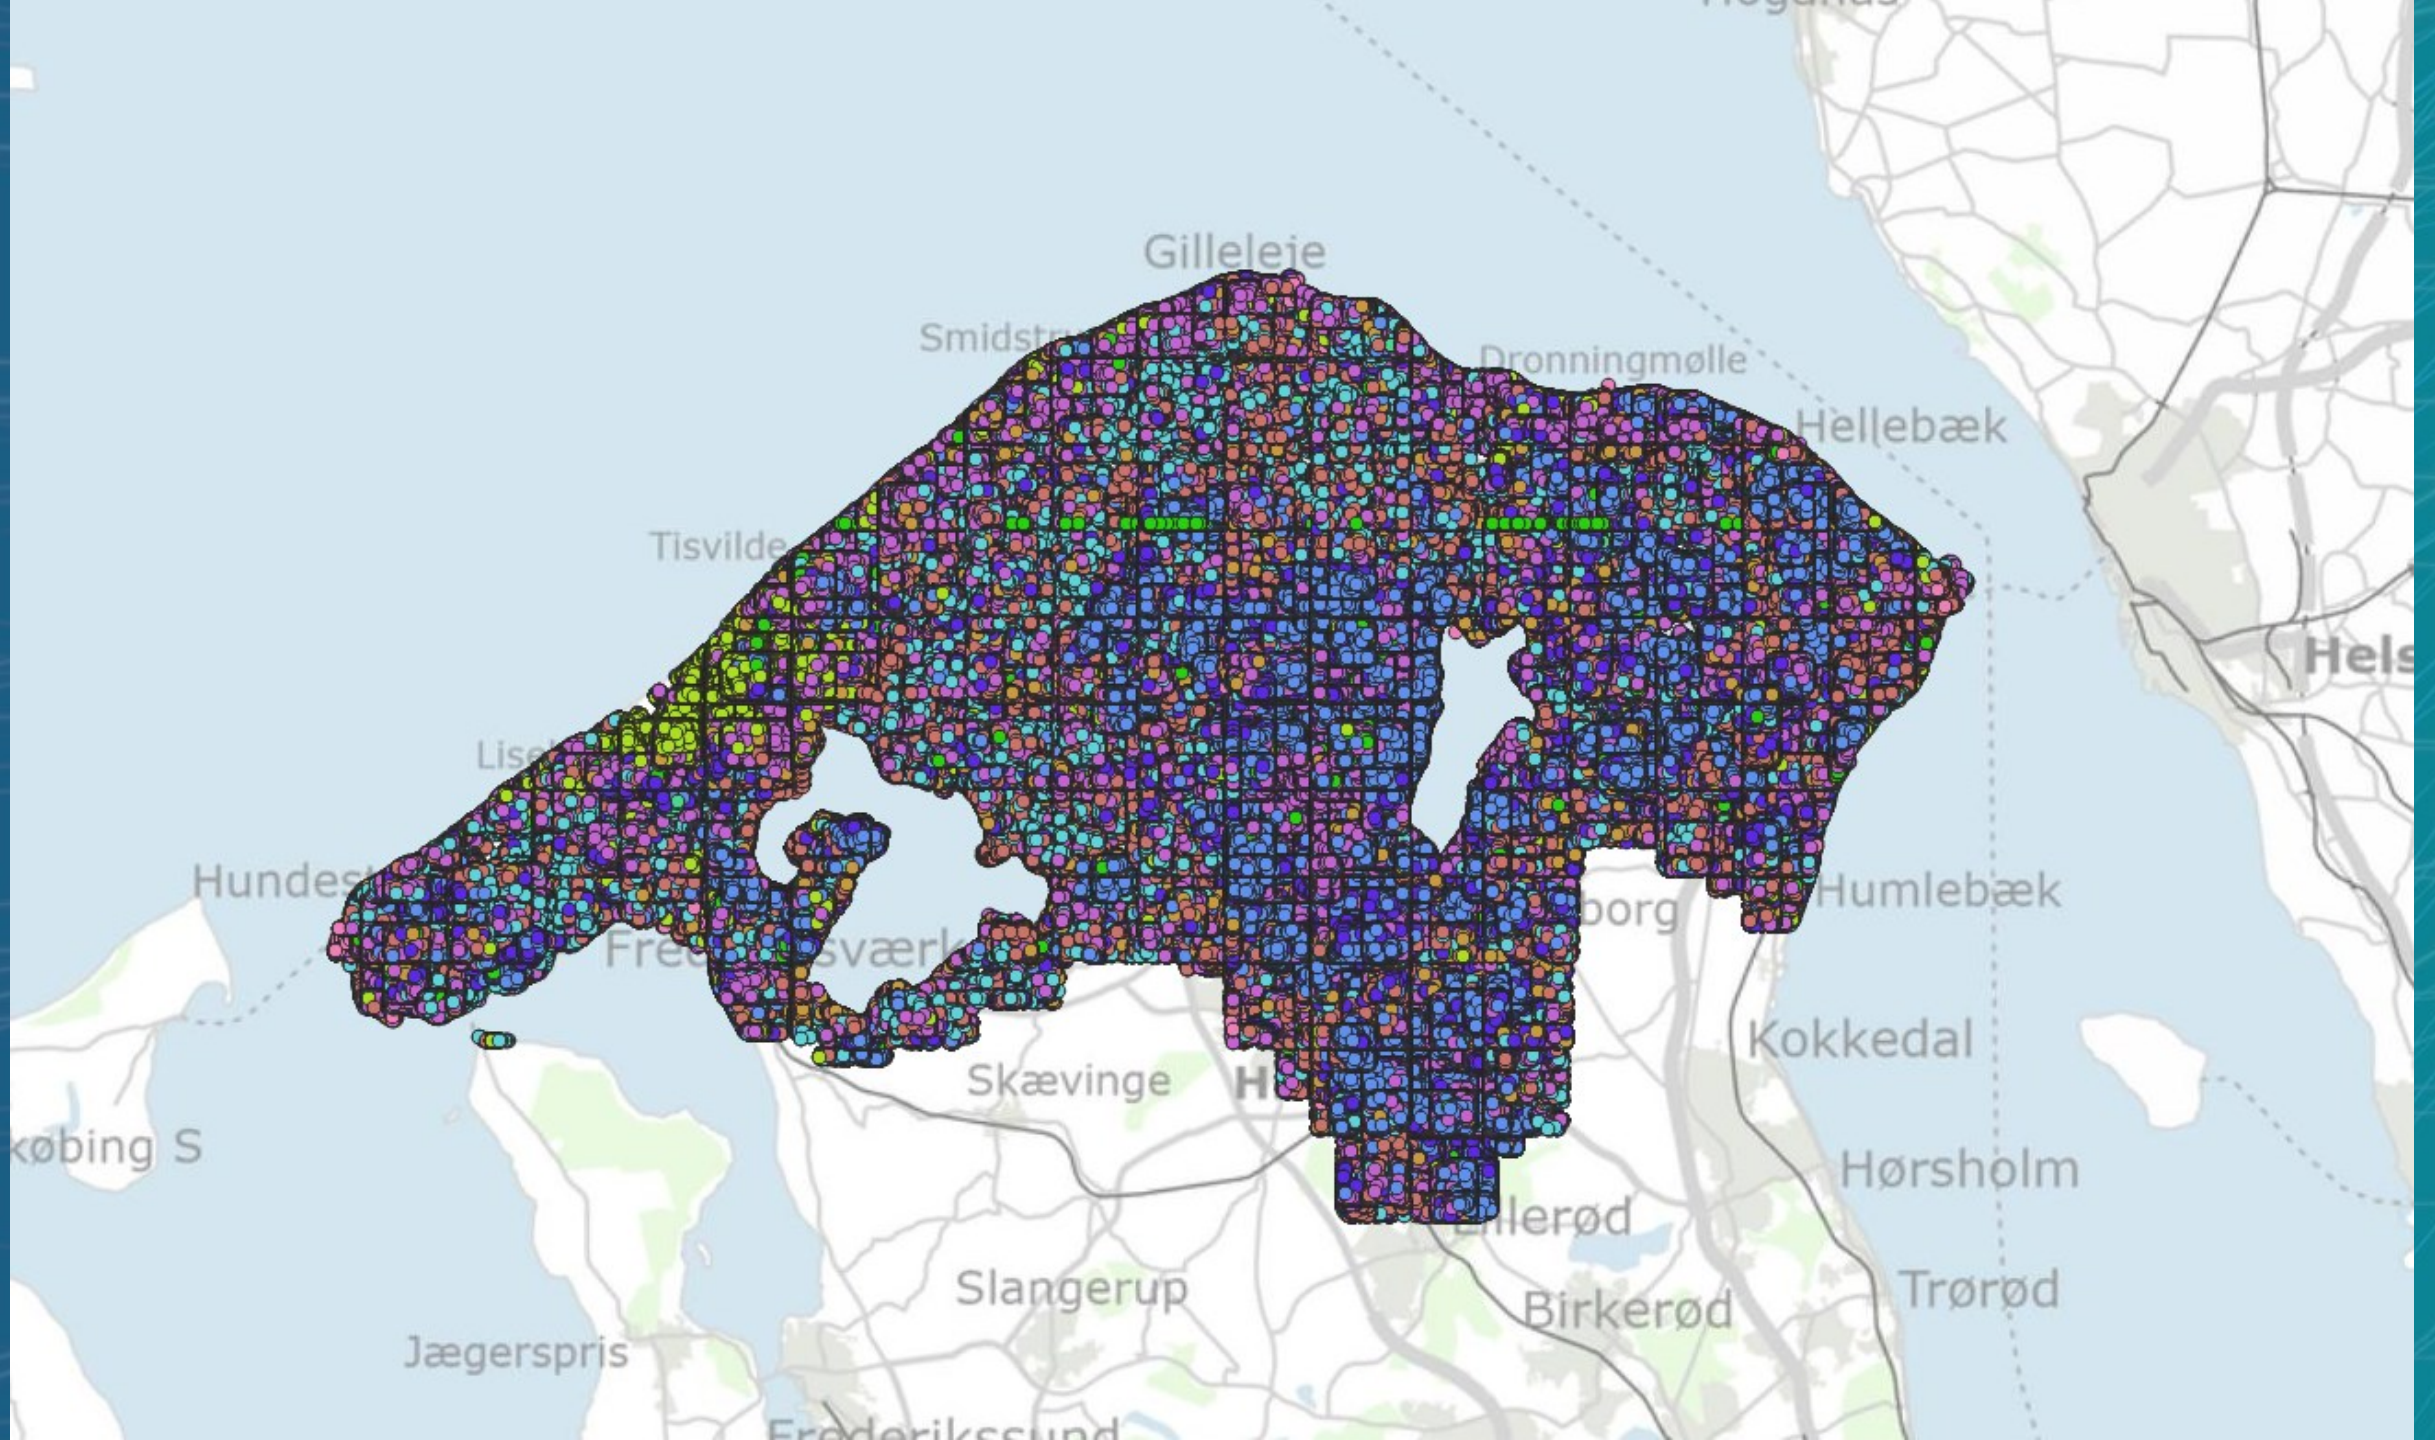

The digital twin is interactive and can be shown on detailed level

# Forests

Polygon dataset (in this example trees are colored by Copernicus forest type, red=non-forest, green=coniferous, yellow=deciduous): each tree is associated with an attribute table containing e.g., crown area/diameter, Copernicus forest type, estimated tree height
